I want to start developing a map of the harbor that can be color coded to show where we are with respect to stormwater evaluation and source control at individual sites. Do you know what would be the best base layer to use for this (i.e., the layer that delineates the sites)? I suppose I could use tax lots, but I wondered if the LWG had something that has been more refined for the Portland Harbor area. For example, if a site covers multiple tax lots, it would be good if the layer shows those as one merged lot. Any suggestions about what to use and how to get it?
